NATF CIP-013-1 Implementation Guidance

Version 1.0
Approval Date: 06/20/2018

Introduction

NERC "Implementation Guidance provides a means for registered entities to develop examples or approaches to illustrate how registered entities could comply with a standard [or requirement within a Standard] that are vetted by industry and endorsed by the ERO Enterprise. The examples provided in the Implementation Guidance are not exclusive, as there are likely other methods for implementing a standard."[1] This NATF Implementation Guidance document describes one way that a registered entity could comply with CIP-013-1 Requirement R1 and, subsequently, parts of CIP-013-1 Requirement R2.

Reliance on Independent Assessments of Vendors as an Acceptable Means of Identifying and Assessing Vendor Risk

The ERO has endorsed the practice of a Responsible Entity obtaining an independent assessment of the vendor's production of BES Cyber Systems and/or related services as a means of complying with CIP-013-1.[2] The "Implementation Guidance for CIP-013" recommends that an entity's risk assessment process to identify and assess potential cyber security risks include "potential risks based on the vendor's risk management controls." Responsible Entities may consider assessing vendor risk-management controls though obtaining a "*summary of any internal or independent cyber security testing performed on the vendor products to ensure secure and reliable operations*."[3]

Responsible Entities that review independent assessments of vendors also build on the ERO-endorsed practice of relying on the "work of others" as a means of obtaining reasonable assurance that defined reliability and security objectives are being met by vendors. The "ERO Enterprise Guide for Internal Controls"[4] promotes ERO Compliance Enforcement Authorities evaluating the independence, capabilities, and competencies of the "work of others" (i.e., disinterested third parties or departments that are independent from the department performing a reliability function) for purposes of compliance monitoring.[5]

Just as the ERO may rely on the "work of others" to assist in determining how to monitor a registered entity's compliance, Responsible Entities, in the context of managing their supply chain risk, may rely on qualified independent assessments of a vendor's risk-management controls to demonstrate that it has assessed cyber security risks associated with the vendor's BES Cyber System.

Following the steps described below builds on the Implementation Guidance for CIP-013 to provide clarity on how the Responsible Entity may meet the obligations in both R1 and R2 when using an independent assessment.

Using Independent Assessments of Vendors

When Developing the Cyber Security Supply Chain Risk Management Plan, the Responsible Entity Describes Option for Relying on Independent Assessment (CIP-013-1, R1)

A Responsible Entity's cyber security supply chain risk management plan, as required in CIP-013-1 R1, may describe the Responsible Entity's process to:

1. ask vendors to provide an independent assessment (that also describes the methodology for performing that assessment) from a certified auditor, that evaluates the vendor's controls and tests specific control activities to meet, at a minimum, the criteria identified in CIP-013-1 R1 part 1.2 (see Attachment A);

2. assess the results of the third-party, independent assessment;

3. document its evaluation of the independent assessor's methodology and conclusions to determine whether any additional mitigating actions are appropriate to manage risk; and if so, document those mitigating actions.

A Responsible Entity could choose to include this process as the only R1 process in its overall R1 plan or it could be one of several processes that meet the R1 requirements in its overall R1 plan.

Using an Independent Assessment as a Means for Implementing the Cyber Security Supply Chain Risk Management Plan (CIP-013-1, R2)

For those BES Cyber Systems and/or related services for which the Responsible Entity has determined that it is appropriate to obtain an independent assessment, the Responsible Entity may show that it implemented its Plan as required in CIP-013-1, R2 through documenting that it:

1. asked for and received a third-party, independent assessment, and documented its conclusion that the independent assessor was appropriately qualified;

2. confirmed (such as by using a predefined checklist) that the results of the third-party, independent assessment address the topics in CIP-013-1 R1.2;

   - **Attachment A** summarizes minimum criteria a Responsible Entity may use to review the third-party assessment. (It also provides additional criteria a Responsible Entity might consider.)

   - **Attachment B** provides a predefined list of examples of known security frameworks that address the security topics specified in CIP-013-1, R1.2.

3. documented any mitigating activities by the Responsible Entity or the vendor to address risks identified by the third-party, independent assessment to the extent the Responsible Entity concluded that additional risk mitigation was necessary in order to procure the BES Cyber System.

The documentation maintained by the entity would demonstrate that the entity used its supply chain cyber security risk management plan required in R1 and, therefore, met its requirements under R2. Responsible Entities do not need to include such actions, or vendor commitments to further mitigate risk, in contracts for BES Cyber Systems.[6]

---

[6] *See* CIP-013-1, R2 Note ("Implementation of the plan does not require the Responsible Entity to renegotiate or abrogate existing contracts (including amendments to master agreements and purchase orders). Additionally, the following issues are beyond the scope of Requirement R2: (1) the actual terms and conditions of a procurement contract; and (2) vendor performance and adherence to a contract.")

Attachment A – Cyber Security Criteria

At a minimum, entities assess whether their vendor(s) can meet basic security criteria.

Notification/Recognition of Cyber Security Incidents

Vendors need to be able to identify when an incident occurred to ensure that the vendor can notify the entity in the case of an incident. To meet this requirement, the vendor may have aligned with numerous cyber security frameworks (see table 1 in attachment B).

Coordination of Responses to Cyber Security Incidents

Vendors should coordinate with the entity their responses to incidents related to the products or services provided to the entity that pose cyber security risk to the entity. To meet this requirement, the vendor may have aligned with numerous cyber security frameworks (see table 1 in attachment B).

Notification when Remote or Onsite Access is No Longer Needed or Should No Longer be Available to Vendor Representatives

Vendors should respond accordingly to personnel changes. A vendor should be able to tell the entity when a personnel change occurs that could impact whether or not remote access should still be available to vendor representatives. To meet this requirement, the vendor may have aligned with cyber security frameworks that control use of administrative privileges and/or control access based upon a need to know (see table 1 in attachment B).

Vulnerability Identification

Vendors are to notify an entity when a vulnerability related to a product or service is identified. In order to meet this obligation, a vendor needs to know when a vulnerability exists in their environment. To meet this requirement, the vendor may have aligned with cyber security frameworks that require continuous vulnerability assessment and mitigation (see table 1 in attachment B).

Verification of Software Integrity and Authenticity of all Software and Patches Provided by the Vendor for Use in BES Systems

Vendors are to provide the capability to ensure the integrity and authenticity of all software and patches provided to an entity. In order to meet this obligation, a vendor may have aligned with cyber security frameworks that require application software security (see table 1 in attachment B).

Coordination of Controls for Vendor-Initiated Interactive Remote Access and System-to-System Remote Access with a Vendor

Vendors must coordinate with entities to control vendor-initiated interactive remote access and ensure system-to-system remote access with a vendor is appropriately managed. To meet this requirement, the vendor may have aligned with cyber security frameworks that require account monitoring and control (see table 1 in attachment B).

At a minimum, the vendor should align with the above 6 basic principles of cyber security. The entity may define additional criteria for any vendor, as described below.

As an entity performs a risk assessment and considers risk exposure of products or services to be procured in its environment, additional cyber security controls may be necessary to protect the entity's operating environment. An entity may consider obtaining and evaluating additional information regarding the vendor's capabilities with respect to the following security areas.

Asset, Change, and Configuration Management

Inventory of Authorized and Unauthorized Devices

- Physical devices and systems within the organization are inventoried

- Software platforms and applications within the organization are inventoried

- Organizational communication and data flows are mapped

- External information systems are catalogued

Change Control and Configuration Management Considerations

- Uses a recognized framework for its information technology processes (e.g., ITIL)

- Includes security in its system development life cycle

- Has a mature change-control process

- Maintains separate development and production environments

- Maintains separate environments for different customers

- Has mechanism for software integrity (e.g., PKI with encryption, digital signature)

- Product allows for hardening to minimize attack surface

- Processes to identify, discover, inventory, classify, and manage information assets (hardware and software)

- Processes to detect unauthorized changes to software and configuration parameters

- Able to identify whether hardware, software, or components are U.S. and/or internationally sourced

Governance

Establish and Implement Security Awareness Program

- Documented and implemented security policy and procedures

- All users are informed and trained on cybersecurity policies and procedures

- Third-party stakeholders understand roles and responsibilities and are accountable to same requirements

- Senior executives understand roles and responsibilities

- Physical and information security personnel understand roles and responsibilities

- Ability to provide ongoing support for software and hardware

- Personnel background checks

- Ability to retain data for events such as litigation holds, cyber security incidents

- Presence of trained, knowledgeable, and sufficient cyber security resources

- Supplier has certifications for manufacturing process (e.g., ISO)

Logging and Monitoring Considerations:

- Maintains a program to perform continuous logging, monitoring, and analysis of its systems to identify events of significance

- Has sufficient segregation of duties to ensure logging and monitoring are effective to detect anomalies

Information Protection Considerations

- Uses appropriate controls to manage data at rest (vendor or entity data)

- Ability to provide additional hardware for failures

- Encrypts credentials in transit, internal and externally

- Encrypts credentials at rest

- Uses strongest standard encryption algorithms (e.g., AES or SHA-2)

- Supplier physical access controls to hardware, software, and manufacturing centers

- Physical devices and systems within the organization are inventoried

- Supplier location of data centers (U.S./Canada-based vs international)

Attachment B – Cyber Security Framework Mapping

Entities use appropriate subject-matter experts to develop cyber security policy. Various security frameworks that entities may find useful for developing their cyber security policy are mapped in table 1 below. **Table 1 provides example mapping and is not an all-inclusive list.**

Notable cyber security frameworks and best practices include:

- Center for Internet Security (CIS) Critical Controls

- NIST Cyber Security Framework

- PCI DSS

- HIPAA

- COBIT 5

- AICPA SOC 2 and SOC 3 Trust Services Criteria

- NATF Security Principles of Excellence

- NERC Reliability Standards
