Transmission Resilience Overview

Definition and Scope
Transmission system resilience is defined as the ability of the system and its components (i.e., both the equipment and human components) to minimize damage and improve recovery from non-routine disruptions, including high impact, low frequency (HILF) events, in a reasonable amount of time.

Background
The electric grid serves as a vital societal function and an essential aspect of national security. Every sector of the national economy, including food production, banking, manufacturing, and retail distribution, depends on it. Electricity users have come to expect a high degree of electric reliability and availability, and meeting those customer expectations is a fundamental delivery requirement for all electric utilities.

Beyond the economy, extended power outages can also have severe consequences on society at large, specifically for things such as national defense, communications, water and wastewater, healthcare, emergency management, transportation, and law enforcement. Considerations during outages also include interdependencies among critical infrastructures (e.g., the gas and electric industries); needs for workforce support; and local, state, and federal collaboration and assistance.

Version 3.1 Approval Date: 05/19/2021 Document ID: 1042
While delivery of electric service has been very consistent and highly reliable for much of the past 100 years of the development, expansion, and continuous operation of the power grid across North America, the industry realized that the focus solely on reliability, based on frequency and duration of power outages, may be insufficient in improving system integrity and availability of electric power going forward. As the threat landscape changes or becomes better known, it is apparent that the electric grid also needs to be capable of timely recovery from more severe, non-routine, larger impact and duration events in order to minimize the impacts on society overall.

**NATF Resilience Activities**

The North American Transmission Forum (NATF) has been actively working to support and improve transmission system resilience. In 2013, the NATF, in conjunction with the Electric Power Research Institute (EPRI), began holding resilience workshops on geomagnetic disturbances (GMD), which ultimately evolved into our annual resilience summits. The summits have transformed to cover resilience holistically, including topics not only on GMD, but also electromagnetic pulse, cyber resilience, resilient communications, system hardening, spare strategies, incident command system, resilience-related investments, and more. The NATF has also initiated several other efforts to enhance resilience.

**Transmission Resilience Steering Group**
- Forum and resource to set course for resilience activities
- Includes EPRI and RESTORE liaisons

**Transmission Resilience Maturity Model (TRMM)**
- Free, easy-to-use tool (publicly available)
- Designed for transmission utilities to evaluate/trend resilience program maturity
- Jointly developed with U.S Department of Energy (DOE), Pacific Northwest National Laboratory, and EPRI
- NATF-facilitated TRMM assessment offering for members

**Grid Security Emergency (GSE) Support**
- Working with the Electricity Subsector Coordinating Council and U.S. DOE
- Focus on template orders, communications during GSE, and decision-support tools

**Summits and Webinars**
- Annual summits in conjunction with NERC and EPRI
- Special webinars (TRMM, physical security, spare equipment, transmission planning for system resilience)

**RESTORE Spare Sharing Program**
- Optional, self-funding program is available to NATF members at minimal additional costs
- Voluntary agreement to share available spare equipment (transformers) following major event
- Complementary to other industry programs (STEP; Grid Assurance)

Status and Approach

As evidenced by the broad-ranging topics for the summits over the years, progress has been made on many fronts related to resilience activities and research. Improving resilience requires a systematic, strategic approach and cost-effective solutions that may be unique for individual utilities. Investment strategies for hardening the system, upgrading assets, and acquiring and maintaining spare equipment need to be cost-effective, flexible, and agile, while accommodating the adoption of new technologies. A comprehensive plan to address resilience requires an “all hazards” approach.

Efforts to improve reliability and resilience involve risk-based, strategic decisions that may be different for individual utilities. Available resources, level of risk tolerance, geographical locations, and regulatory policies will influence the type of investments, planning, designs, construction, upgrades, and operations for each system. New threats, hazards, and vulnerabilities continue to emerge even as utilities work to protect against today’s challenges, so utilities must remain vigilant.

Resources

The NATF produces resources for members and the industry at large. Resilience documents available for the industry are posted on our public site at https://www.natf.net/documents.
